Historical Note

Osteopathic Medicine was founded by Andrew Taylor Still, M.D. in 1874. Controversial at first, this system opposed most of the established medical practices of the 1800's and early 1900's, which included treatments such as bloodletting and the use of purgatives, mercury, and alcohol-based compounds by physicians who were poorly or incompletely trained.

The son of a Methodist minister, Still attended the College of Physicians and Surgeons in Kansas City, Kansas. He also served as a state legislator and enlisted in the Ninth Kansas Cavalry during the Civil War. After the war, Still provided health care to settlers and Native Americans. He became increasingly dissatisfied with the established medical practices of the day while he was treating the epidemics of the time period, including cholera, pneumonia, smallpox, meningitis, diphtheria, and tuberculosis.

Still avoided the liberal use of drugs in his search for alternative therapies, believing that his role as a physician was to facilitate the body's inherent ability to heal itself. He developed osteopathic manipulative treatment and a philosophy of medicine that was based on his experiences. His intent was not to create a separate profession; rather, his goal was to improve the system of medicine. Although his ideas were initially rejected by the medical community, D.O.s received full practice rights in all 50 states by 1973. Presently, there are over 60,000 D.O.s in the United States, with more joining the profession each year.
